2. Forward:

**Warning** - In the pages of this document are a diverse set of truck chassis system and subsystem integration features which contain the potential for both simple and complex operational situations and interactions when integrated in combination with a truck chassis and truck mounted equipment. It is the responsibility of persons performing truck chassis and, or truck mounted equipment system integration and testing to fully understand the plurality of operational outcomes and take the appropriate as well as necessary precautions to avoid property damage, personal injury up to and including death when performing system integration and, or test in association with the content of this document.

**Note** - In this manual, International® Truck and Engine Corporation provides information about its different products to assist those who wish to modify these products for individual applications. International does not recommend or approve any firm nor make any judgements on the quality of the work performed by a particular firm. Individuals who use the services of a Body Builder must satisfy themselves as to the quality of the work.
The party installing a body, a fifth wheel, any other equipment, or making any modifications to complete the vehicle for delivery and make it road-ready is responsible to see that the completed vehicle complies with all applicable certification procedures and safety standards, as may be set forth in Federal, State, and local statutes, rules and regulations.

Specifications, descriptions and illustrative material in this literature are as accurate as known at time of publication but are subject to change without notice. Illustrations are not always to scale and may include optional equipment and accessories but may not include all standard equipment.

Safety Information:

**IMPORTANT** - Read the following before starting the service procedure.

You must follow your company safety procedures when you service or repair equipment. Be sure to understand all procedures and instructions before you begin work on the unit. Some procedures require the use of special tools for safe and correct service. Failure to use these special tools when required can cause injury to service personnel or damage to vehicle components.

**DISCLAIMER:** INTERNATIONAL DOES NOT TAKE ANY RESPONSIBILITY FOR CUSTOMER OR BODY BUILDER WIRING.

**NOTE** - After-market installed wiring for engine speed control must comply with the following guidelines:

1. Sealed switches and connectors must be used for switches and connections that are exposed to the weather or to salt spray emanating from the vehicle’s tires.

2. Route and clip wiring to minimize chafing and exposure to weather. Use conduit, loom, and/or tape to achieve this.

3. Fuse all power leads as close to the power source as possible. Remember fuses protect the wiring - size fuses accordingly.

4. All ground connections that will be made to the frame or body must be connected to clean bare metal. Remove all dirt, paint, grease and rust that would insulate the terminal from ground. After connecting the ground, seal the connection with a good quality grease or surface sealant to protect the connection from corrosion.

5. Spliced wires should be twisted together and soldered. Use a heat shrink tube with a meltable inner wall to seal the connection. Do not expose splices to the weather.
**WARNING** - To avoid serious personal injury, possible death, or damage to the vehicle, make sure the transmission is in neutral, parking brake is set, and the wheels are blocked before undertaking service procedures. In addition, turn off the engine when you leave the vehicle. Never leave the vehicle unattended with the engine running.

**WARNING** - To avoid personal injury, possible death, or damage to the vehicle when adding electrical features, disconnect batteries. Reconnect batteries when installation is complete.

Whenever disconnecting battery terminals; always disconnect the ground terminal first. When reconnecting, always connect the ground terminal last. To prevent injury to the eyes, face, limbs and body, it is imperative that lighted materials, flames or sparks be kept away from the vent openings of the battery. The gas mixture in the battery cells, which escapes through the vents, could ignite and/or cause an explosion. This is particularly true when jumper cables are being used.

In addition, inhaling of gas produced by the normal operation of the battery could result in partial or permanent damage to the respiratory system. Always wear eye protection when working around batteries. Do not attempt to jump-start a vehicle having a frozen battery because the battery may explode. If a frozen battery is suspected, examine all fill vents on the battery. If ice can be seen, do not attempt to start with jumper cables as long as the battery remains frozen. Thaw out the battery and recharge.

Do not check battery condition by shorting (flashing) across terminals. Failure to observe these instructions could result in personal injury and/or damage to the vehicle.

Battery cable terminals must be clean and tight. Use hot water and common baking soda for removing terminal corrosion and for cleaning the top of the battery. Brighten the contact surface with steel wool, apply a light coat of lubricant sealing grease such as Fleetrite ® 472141-C1 or equivalent and reassemble. Be sure the terminals are clamped tightly and that the battery is clamped securely in place.

When working around the terminals and battery, use extra care to avoid shorting. A good practice is to insulate pliers and screwdrivers.

### 3. Vehicle Architectures:

#### 3.1. Multiplexing Architecture:

Unlike the electrical systems on previous models, which utilized point-to-point wiring for all input signals and output loads, this system uses multiplex technology to provide control and communication between major functional areas of the vehicle. Multiplexing simply means, communicating multiple pieces of information via a single twisted pair of wires (called the data link) without requiring a wire for each piece of information. This
information could be gauge information such as engine oil pressure, or switch information that controls vehicle functions such as headlamps.

The electrical system relies on a collection of electronic circuit modules and software to perform vehicle functions instead of implementing similar features using complex wire harness designs with electromechanical relays and switches. These electronic module components are connected together by data links. The data links can be thought of as computer networks that allow the electronic components on the vehicle to communicate with one another.

The concept of multiplexing is not new since data links for communicating between engine controllers, the instrument cluster and the diagnostic connector have been used for several years.

The goal of multiplexing is to reduce cab harness wiring and to simplify circuits. This is accomplished by using a low current data link for communicating between cab switches, the Body Controller and the Instrument Cluster. Other data links in the vehicle allow other electrical controllers, the BC and the Instrument Cluster to communicate with each other.

3.2. Power Take Off (PTO) & Engine Speed Controls (Sales Feature Code 12WGG)

**Feature Description:** Engine speed control for electronically controlled Power Take Off (PTO) device, includes On/Off switch mounted on Dash, with steering wheel mounted engine speed control button.

3.3. Power Take-Off (PTO) - Quick Start Reference

The PTO is an Truck Equipment Manufacture (TEM) integrated system that allows the user to create an auxiliary power source for running add-on equipment, such as salt spreaders, dump beds, lifts, winches, and lift buckets etc. The PTO system controls engine speed to values higher than normal base idle, PTO load relay engagement, and remote starting and shutdown of the engine.

**PTO Components**

The OEM PTO components consist of:

- The transmission [internal] PTO gear – rotates with the torque converter
- The in-cab PTO switch and cruise control SET and RES switches
- The PTO telltale indicator
- The Driver Information Center (DIC)
- The Radio and Navigation Screen (HMI)
- The Power Take Off Module (PTOM)
- The remote PTO Truck Equipment Manufacture (TEM) connector [X191]
**Note:** The interface connector [X191] is located at the rear of the cab near the RH frame rail and comes with a cap which is the mating half to the truck harness connector. This is the connector the Truck Equipment Manufacture (TEM) will use to wire in external electrical components such as a control relay, oil solenoid [these two are basic to all systems] and possibly external switches to control the PTO from outside the cab.

3.4. Factory PTO Settings

The PTO system is *programmed in the plant for a basic 3 speed idle up [Stationary Preset] mode* with the relay control circuit enabled and ready to close a control relay. [The relay is not included and must be added by the Truck Equipment Manufacture (TEM).] For most customers the only electrical connections that are required are a control relay and an oil solenoid. The system is ready to go. [Older systems did not have the relay driver turned on so they would not engage the PTO until reprogrammed at a dealer. That has been corrected.]

**The three factory speeds are:**

1. 900 RPM – occurs with press and release of the PTO switch
2. 1200 RPM – occurs with press and release of the Cruise SET switch [if PTO is ON]
3. 1900 RPM – occurs with press and release of the Cruise Resume Switch [if PTO is ON]

See schematic below. The components in the grey shaded box are what must be connected to X191 for basic in cab operation [Stationary Preset].

**IMPORTANT:** On a new unit before *anything* is connected, start the truck in park with the park brake set and the Cruise Control Switch is OFF. Press and release the PTO in-cab Switch. You should be able to achieve the 3-speed operation described above. If not, have the dealer fix it before you proceed! When proper idle up operation is confirmed THEN connect your components.
Figure 4.2.1: Schematic for basic 'inside' PTO operation using control relay and oil solenoid as well as optional outside 'remote' operation [start/stop, tap up/down]

**NOTE:** The PTO connector X191 has a cap installed at the assembly plant with a jumper between pins A and J. The cap is a useable mating connector and it could be rewired as shown above. To avoid setting internal trouble codes the continuity between connector cavities A and J must be constantly maintained except during kill switch actuation for MY2015-17. MY2018 and beyond the jumper is only required for remote operation if arm and kill switches are not configured.
NOTES:

1. Cavity N control signal must be implemented with a switch OR a potentiometer, not both.

2. For MY2015-17 continuity between pins A & J is monitored, must be maintained. It can be interrupted only during the actuation of the kill switch. Continuous loss of continuity between pins A and J will result in setting system trouble codes.

3. For MY2018 and beyond the A to J jumper is not required except for remote modes where the ‘arm’ and ‘kill’ switches are not configured.
3.5. Primary PTO Operating Modes
PTO modes of operation include the following:

- **Preset** [*Stationary*]
  In-cab control standard. Remote control available. New for 2017 – in cab engage with remote control

- **Variable** [*Stationary*]
  In-cab control standard. Remote control available. New for 2017 – in cab engage with remote control

- **Mobile**
  In-cab control only

- **OSIM** (Operator Selectable In-Cab Mode) [*Stationary or Mobile*] is new for 2017, requires ‘pairing’ and then one of the two ‘paired’ modes can be selected each key cycle.

**Notes:**

- Factory default programming enables in-cab controls.
- A Navistar CV vehicle service tool can reprogram the system to allow for remote control. In-cab controls can be left active [in-cab engage with remote control] or disabled. OSIM can be enabled for dual stationary/mobile mode pairing.
- All PTO modes provide for engine rpm control and PTO load relay control [engage/disengage].
- All PTO modes provide for safety interlocks for PTO load disengagement.
- Remote PTO modes provide for both in-cab and remote engine starting, and shutdown. **Emergency vehicle provisions for PTO are not compatible with remote mode.**
- All Stationary PTO modes provide for engine shutdown due to critical engine conditions, as well as a timed engine shutdown feature. However, when ordering any Navistar Emergency Vehicle vocational sales applications, Automatic Engine Shutdown is disabled.
- **Emergency Vehicle provisions for PTO are limited to the disabling the following Automatic Engine Shutdown conditions**
  a) Low Fuel
  b) Engine Coolant Hot
  c) Transmission Fluid Hot
  d) Low Engine Oil
  e) Low Engine Oil Pressure
  f) Diesel Particulate Filter Regeneration Warning

**Note:** Engine shutdown, based on critical engine or PTO system fault conditions could be disabled using the service tool for non-emergency application. “PTO
Engine Shudown" Parameter needs to be programmed to “Disable” using service tool.

- For remote pendant applications the ‘Remote Pendant Enable Switch’ must be in the open position when connecting or disconnecting the pendant cable.

3.6. Preset PTO Operating Modes and Programming
3.6.1. Preset PTO - In-cab Operation: Enable Conditions [factory default programming]
To Enable PTO the following conditions must be satisfied:

1. Engine must be running.
2. The vehicle cannot be moving.
3. The parking brake must be set.
4. The shift lever must be in PARK [P].
5. The brake pedal must not be depressed.
6. Cruise Control must be OFF.
7. Press and release the PTO In-cab switch, located below the center console. The PTO telltale will blink rapidly until the PTO load relay becomes engaged (Ref. Note 3 below). The telltale will then be steady. The engine will advance to the PTO Standby speed.
8. After PTO Standby speed is achieved the Cruise Control SET- and RES+ switches can be used to accomplish the Set 1 or Set 2 PTO engine speeds. Note: The accelerator pedal is disabled and cannot be used to override the PTO present speeds below.

Table 4.4.1: Factor Default PTO engine speed Values

<table>
<thead>
<tr>
<th>Factory Default PTO Engine Speeds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standby</td>
</tr>
<tr>
<td>Set 1 (SET-)</td>
</tr>
<tr>
<td>Set 2 (RES+)</td>
</tr>
</tbody>
</table>

Note: On a new vehicle the PTO function [3 speed idle up] should be confirmed before any wiring modifications are done. See your Navistar dealer if the default presets are not functioning properly.
1. The PTO Control setting is default programmed to Interior PTO Mode. Remote switch inputs are disabled.
2. Since a PTO load relay is not yet wired in the system, the PTO Telltale does not initially truly reflect the status of the PTO load. The PTO load relay output is enabled as a factory default.
3. When the PTO Telltale is either blinking or on solid, the PTO Relay output will be activated.

3.6.2. Preset PTO - Remote Operation: Enable Conditions [requires programming with Navistar CV vehicle service tool and installation of an appropriate remote switch panel].

   The panel must be provided by the Truck Equipment Manufacture (TEM). Please refer to the schematics above which show how Truck Equipment Manufacture (TEM) supplied equipment is to be wired.

   1. Cruise Control must be OFF (confirm this is OFF before powering down the vehicle with the Ignition key).
   2. The shift lever must be in PARK [P].
   3. The park brake must be set and the hood must be closed.
   4. The engine must be stopped and the Ignition key removed. Vehicle can be locked if desired.
   5. From the Remote Switch Panel close and open the PTO Remote Arm Switch.
   6. Within 5 seconds open and close the PTO Remote Engine Start/Shutdown switch.
   7. The vehicle horn will chirp 3 times, and then engine starting will automatically be initiated. The PTO system will then elevate engine rpm to PTO standby speed and engage the PTO load relay.
   8. The PTO Remote Set switch can now be used to accomplish the PTO Set 1 and Set 2 Engine speeds. **Note:** The accelerator pedal is disabled when remote PTO operation is selected.

Notes:

1. The PTO load relay engages immediately when the PTO operation is initiated by the switch input. This produces a soft engagement because the transmission torque converter is unlocked. The torque converter will lock upon reaching stable PTO Standby Speed [default = 900 rpm] so maximum power is available.
2. The first elevated engine speed – PTO Standby Speed is not intended as a working speed but as a verification that the system is active and ready to go to a working speed. PTO Standby Speed can be modified to a ‘working speed’ with a Navistar CV vehicle service tool. The upper limit for PTO Standby Speed is 1500 rpm.
3. The remote switches and relay connections are made at the PTO Truck Equipment Manufacture (TEM) Connector located on the chassis frame behind the cab.

4. The PTO Control setting on the Service Tool must be programed to “Remote PTO Mode Switch” before the remote switches can be used.

5. The PTO relay is programed to be enabled in the factory default settings.

**Warning:**

Engine exhaust contains Carbon Monoxide (CO) which cannot be seen or smelled. Exposure to CO can cause unconsciousness or even death. Never operate PTO in an enclosed area such as a garage or building that has no fresh air ventilation. See “Engine Exhaust” in the Vehicle Owner Manual.

**Warning:**

If the key is in the ignition during Remote PTO operation, the vehicle can be shifted out of Park by an operator. Even though PTO will be disengaged, depending on PTO Truck Equipment Manufacture (TEM) application, personal injury or property damage may result from vehicle movement. Always remove key from the ignition before operating Remote PTO.

### 3.6.3. Preset PTO - Remote Operation with In-Cab Engage: Enable Conditions

[requires programming with Navistar CV vehicle service tool and installation of an appropriate remote switch panel].

Starting Remote Operation from cab.

1. With the engine running shift the transmission into P (Park).
2. Release the brake pedal and set the parking brake.
3. Assure the cruise control is OFF and the hood is closed.
4. Press and release the In-Cab PTO Switch.
5. The horn will chirp, the PTO load relay will engage, and the engine speed will advance to PTO Standby Speed.
6. The operator may now exit the vehicle. Doors can be locked with key fob [if desired/available].
7. The PTO Remote Set switch can now be used to accomplish the PTO Set 1 and Set 2 Engine speeds. The accelerator pedal is disabled when Remote PTO operation is selected.

PTO Remote operation can be ended by pressing In-Cab PTO Switch, releasing the parking brake, depressing the brake pedal or shifting the transmission out of P (Park). The PTO load relay will be disengaged, and Engine speed will decline to idle speed.
Warning:
While operating your vehicle in stationary PTO mode, the Diesel Particulate Filter (DPF) will continue to filter the exhaust and accumulate soot. The engine control system, depending on the speed and load being applied by the PTO, may not be able to generate enough energy or adequate heat needed to clean or regenerate the DPF. Continued operation under conditions that do not allow effective regeneration or cleaning will eventually plug the DPF and result in reduced power. The ENGINE POWER IS REDUCED Driver Information Center (DIC) message and Malfunction Indicator Lamp will be displayed, and dealer/retailer service will be required to return your vehicle to normal, full power operation. To prevent this from occurring, frequently monitor your vehicle during PTO operation, paying particular attention to the CLEAN EXHAUST FILTER SEE OWNER MANUAL NOW DIC warning message or any horn chirps if operating PTO remotely. If the DIC message [or horn chirp] is presented during PTO operation, see OWNER MANUAL Diesel Particulate Filter for information on how to clean or regenerate the DPF.

3.6.4. Diesel Particulate Filter [DPF] Cleaning during Stationary PTO Operation
If the DPF becomes sufficiently loaded with soot during a PTO session the system will issue a DIC warning message and horn chirps as notification to the operator. If the operator is outside the vehicle [remote operation] he must return to the cab and, if running in ‘key out’ mode, insert and rotate the key to the ‘run’ position to respond to the system messages. [Messages are not displayed unless the key is in the ‘run’ position.]

Notes:
- Manual DPF [cleaning] regeneration can be initiated during a PTO idle up session.
- It is strongly recommended that the exhaust filter be cleaned before continuous PTO usage if possible.
- If a manual regen is initiated during the PTO session the PTOM will retain control of the engine speed and the selected speed will not change as the regen event initiates.
- Low PTO engine speeds and light loading will cause regeneration to take longer.

  To initiate a manual DPF regeneration, see “Manual Regeneration of Diesel Particulate Filter” under Diesel Particulate Filter in the Duramax Diesel Supplement pamphlet in the glove box. See UI Bulletin xxx DPF Regen for more detail.

Warning:
The exhaust system and exhaust gases get very hot during a manual regeneration. Things that burn could touch hot exhaust parts under the vehicle and may catch fire. You or others could be burned. Do not leave the vehicle unattended during a manual
regeneration. If operating from outside the vehicle maintain a safe personal distance away from the hot exhaust or you could be burned.

3.7. Variable PTO Operating Modes and Programming

3.7.1. Variable PTO - In-cab operation: Enable Conditions - [requires programming with Navistar CV vehicle Service tool]

1. With the engine running shift the transmission to P [PARK].
2. Release the brake pedal and set the parking brake.
3. Assure the cruise control is OFF and the hood is closed.
4. Press and release the PTO In-cab switch. The PTO telltale will blink rapidly until the PTO load becomes engaged. The telltale will then be steady. The engine will advance to the PTO Standby speed.
5. After PTO Standby speed is achieved, the Cruise Control Set - and Res + switches can be used to tap up and tap down the engine speed.

Notes:

1. Factory setting for the tap step is 100 rpm and the setting for the ramp rate is 150 rpm/sec. The Navistar CV vehicle service tool can enable the capability to change the default value for tap step via the Radio Customization menu. The default values for both tap step and for ramp rate can be changed with a Navistar CV vehicle service tool.]
2. The accelerator pedal is disabled and cannot be used to control PTO engine speed.
3. [Stationary] Variable PTO operation can be ended by pressing In-Cab PTO Switch, releasing the parking brake, depressing the brake pedal or shifting the transmission out of P (Park). The PTO load relay will bedisengaged and Engine speed will decline to idle speed.

3.7.2. Variable PTO - Remote Operation: Enable Conditions - [requires programming with Navistar CV vehicle service tool and appropriate remote switch panel provided by Truck Equipment Manufacture (TEM)]

1. Shift the transmission to P [Park] and set the parking brake.
2. Assure the Cruise Control is OFF, turn the key off and remove it.
3. The operator may now exit and lock vehicle.
4. From the Remote Switch Panel close and open the PTO Remote Arm Switch.
5. Within 5 seconds open and close the PTO Remote Engine Start/Shutdown switch
6. The vehicle horn will chirp 3 times, and then engine starting will automatically be initiated. The PTO system will then elevate engine rpm to PTO Standby speed and engage the PTO load relay.
7. The desired engine operating speed can now be accomplished. Two versions of engine rpm control are available, switches or potentiometer [according to which one was installed].
   A. Switches – the PTO Remote Tap Up and Tap Down switches can be used to achieve the desired engine speed.
   B. Potentiometer – a PTO Remote Throttle Potentiometer can be used as a continuous variable throttle control to dial in the desired engine speed.

Notes:
1. PTO Remote operation can be ended by:
   A. Opening the remote kill switch
   B. Pressing In-Cab PTO Switch
   C. Releasing the parking brake
   D. Depressing the brake pedal
   E. Shifting the transmission out of P (Park). The PTO load relay will bedisengaged, and Engine speed will decline to idle speed.

2. The PTO load relay engages immediately when the PTO operation is initiated by the switch input. This produces a soft engagement because the transmission torque converter is unlocked. The torque converter will lock upon reaching stable PTO Standby Speed [default = 900 rpm] so maximum power is available.
3. The first elevated engine speed – PTO Standby Speed is not intended as a working speed but as a verification that the system is active and ready to go to a working speed.
4. The remote switches, the remote throttle [if used] and relay connections are made at the PTO Truck Equipment Manufacture (TEM) Connector located on the chassis frame behind the cab.
5. The engine speeds can be adjusted between the low of PTO Standby Speed and the high of PTO Max Engine speed limits. Both values can be modified from the factory default settings with a Navistar CV vehicle service tool.
6. Factory setting for the tap step is 100 rpm and the setting for ramp rate is 150 rpm/sec. The default value for tap step can be modified via the Radio Customization menu. The default values for both tap step and for ramp rate can be changed with a Navistar CV vehicle service tool.
7. The PTO Control setting must be programmed to “PTO Remote Mode Switch Status = Enabled” with Service Tool.
8. The potentiometer option for controlling PTO engine speed is selected with the Service Tool by setting “PTO Remote Mode Switch Configuration = Variable.”
9. The PTO Load Relay is “enabled” as the factory default programmed setting.

**Warning:**
Engine exhaust contains Carbon Monoxide (CO) which cannot be seen or smelled. Exposure to CO can cause unconsciousness or even death. Never operate PTO in an enclosed area such as a garage or building that has no fresh air ventilation. See “Engine Exhaust” in the Vehicle Owner Manual.

**Warning:**
If the key is in the ignition during Remote PTO operation, the vehicle can be shifted out of Park by an operator. Even though PTO will be disengaged, depending on PTO Truck Equipment Manufacture (TEM) application, personal injury or property damage may result from vehicle movement. Always remove key from the ignition before operating Remote PTO.

3.7.3. **Variable PTO - Remote Operation with In-Cab Engage**: Enable conditions [requires programming with Navistar CV vehicle service tool and appropriate remote switch panel provided by Truck Equipment Manufacture (TEM)]

Starting Remote Operation from cab:

1. With the engine running shift the transmission to P (Park) and release the brake pedal.
2. Assure the cruise control is OFF and the hood is closed.
3. Set the parking brake
4. Press and release the In-Cab PTO Switch.
5. The horn will chirp, the PTO load relay will be engaged and the engine speed will advance to PTO Standby Speed.
6. The operator may now exit the vehicle. The vehicle doors may be locked with the key fob [if desired/available]
7. From the exterior panel the desired engine operating speed can now be accomplished. Two versions of engine rpm control are available, switches or potentiometer, depending on which was installed.
   A. Switches - the PTO Remote Set Switch can be used to tap up and tap down to the desired engine speed.
   B. Potentiometer - a PTO Remote Throttle Potentiometer can be used as a continuous variable throttle control to dial in the desired engine speed.

**Notes:**

1. The accelerator pedal is disabled when Remote PTO operation is selected.
2. PTO Remote operation can be ended by:
   A. Opening the remote kill switch [if wired and configured]
B. Pressing In-Cab PTO Switch  
C. Releasing the parking brake  
D. Depressing the brake pedal  
E. Shifting the transmission out of P (Park). The PTO load relay will bedisengaged and Engine speed will decline to idle speed.  

Warning:

While operating your vehicle in stationary PTO mode, the Diesel Particulate Filter (DPF) will continue to filter the exhaust and accumulate soot. The engine control system, depending on the speed and load being applied by the PTO, may not be able to generate enough energy or adequate heat needed to clean or regenerate the DPF. Continued operation under conditions that do not allow effective regeneration or cleaning will eventually plug the DPF and result in reduced power. The ENGINE POWER IS REDUCED Driver Information Center (DIC) message and Malfunction Indicator Lamp will be displayed, and dealer/retailer service will be required to return your vehicle to normal, full power operation. To prevent this from occurring, frequently monitor your vehicle during PTO operation, paying particular attention to the CLEAN EXHAUST FILTER SEE OWNER MANUAL NOW DIC warning message or any horn chirps if operating PTO remotely. If the DIC message [or horn chirp] is presented during PTO operation, see OWNER MANUAL Diesel Particulate Filter for information on how to clean or regenerate the DPF.

3.8. Diesel Particulate Filter [DPF] Cleaning during Stationary PTO Operation

If the DPF becomes sufficiently loaded with soot during a PTO session the system will issue a DIC warning message and horn chirps as notification to the operator. If the operator is outside the vehicle [remote operation] he must return to the cab and, if running in 'key out' mode, insert and rotate the key to the 'run' position to respond to the system messages. [Messages are not displayed unless the key is in the 'run' position.]

Notes:

- Manual DPF [cleaning] regeneration can be initiated during a PTO idle up session.
- It is strongly recommended that the exhaust filter be cleaned before continuous PTO usage if possible.
- If a manual regen is initiated during the PTO session the PTOM will retain control of the engine speed and the selected speed will not change as the regen event initiates.
- Low PTO engine speeds and light loading will cause regeneration to take longer.

To initiate a manual DPF regeneration, see “Manual Regeneration of Diesel Particulate Filter” under Diesel Particulate Filter in the Duramax Diesel Supplement pamphlet in the glove box. See UI Bulletin xxx DPF Regen for more detail.
Warning:

The exhaust system and exhaust gases get very hot during a manual regeneration. Things that burn could touch hot exhaust parts under the vehicle and may catch fire. You or others could be burned. Do not leave the vehicle unattended during a manual regeneration. If operating from outside the vehicle maintain a safe personal distance away from the hot exhaust or you could be burned.

3.9. Mobile PTO Operating Modes and Programming
3.9.1. Mobile PTO - *in-cab operation only:* Enable Conditions - [requires programming with Navistar CV vehicle service tool]

1. Engine must be running.
2. Cruise Control must be OFF.
3. Engine rpm must be less than 1500 rpm [Maximum PTO Engage Speed]
4. Transmission Shift Lever must be in manual shift selection M1, M2 or M3.
5. The brake must be tapped at least once and then remain released.
6. Press and release the PTO In-cab switch. The PTO telltale will blink rapidly until the PTO load becomes engaged. The telltale will then be steady. The engine speed will remain at the current throttle setting or advance to PTO Standby Speed, which ever value is greater. If the engine rpm is above 1500 rpm the PTO relay will not engage until the engine rpm drops below 1500.
7. Once engaged if additional engine speed is desired two control methods are available – Cruise switches or accelerator pedal.
   A. Cruise Res + switch can be used to tap up [or if continuously held to ramp up (see Table in Section 11 for factory preset parameters)] to the desired operating speed. The Cruise Set - switch can be used to tap down [or coast down if continuously held] to the desired engine speed. [Top limit is PTO Max Engine Speed – default 2100 rpm and programmable to 2900 rpm. Lower limit is PTO Standby Speed – default 900 rpm with program range from base idle to 1500 rpm.]
   B. Accelerator pedal – can be used to achieve the desired speed. When the desired speed is accomplished the Cruise Set - switch would be used to capture and maintain that speed. Normal tap up and tap down can then be used to fine tune the setting.

Notes:

1. In Mobile PTO mode the vehicle speed achieved is the result of the current engine speed requested and the transmission gear range selected. When vehicle is placed in M2 or M3, the vehicle will upshift
according to engine RPM set point, and vehicle speed will increase. To prevent upshifts and maintain lower vehicle speeds, place vehicle in M1.
2. Mobile mode [engine speed capture] is disengaged similarly to cruise control disengagement. See PTO System Disengage Conditions - Mo bile Mode for more details.

3.10. OSIM PTO (Operator Selectable In-Cab Mode)
[New feature for 2017]

Note: Requires programming with Navistar CV vehicle service tool to configure Stationary & Mobile ‘Paring.’ Available ‘pairs’ are preset and mobile or else variable and mobile. Used for vehicles that require 2 PTO modes. Remote operation is not available.

3.10.1. OSIM PTO - Preset [Stationary] Operation: Enable Conditions
OSIM Preset operation can be initiated as follows:
1. With the engine running shift the transmission into P (Park) and release the brake pedal.
2. Assure the cruise control is OFF and the hood is closed.
3. Set the parking brake.
4. Press and release the In-Cab PTO Switch - the PTO indicator LED will begin flashing.
5. Within 10 seconds press and release the cruise Set (-) switch. The PTO indicator LED will go ON steady, the PTO load relay will be engaged and the engine rpm will advance to PTO Standby Speed.
6. Again, press and release the Cruise Set (-) switch to go to PTO Set 1 Speed.
7. Press and release the Cruise Resume (+) switch to go to PTO Set 2 Speed.

3.10.2. OSIM PTO - Variable [Stationary] Operation: Enable Conditions
OSIM Variable Stationary Operation can be initiated as follows:
1. With the engine running shift the transmission into P (Park) and release the brake pedal.
2. Assure the cruise control is OFF and the hood is closed.
3. Set the parking brake.
4. Press and release the In-Cab PTO Switch - the PTO indicator LED will begin flashing. Within 10 seconds press and release the cruise Set (-) switch. The PTO indicator LED will go ON steady, the PTO load relay will be engaged, and the engine rpm will advance to PTO Standby Speed.
5. The desired operating speed can now be accomplished by tapping up and down with the Cruise Resume (+) and Set (-) switches.
3.10.3. OSIM PTO - **Mobile Operation**: Enable Conditions

OSIM Mobile Operation can be initiated as follows:

1. Engine must be running.
2. Cruise Control must be OFF.
3. Engine rpm must be less than 1500 rpm [Maximum PTO Engage Speed]
4. With the vehicle rolling slowly, shift the transmission to M1, M2 or M3.
5. The brake pedal must be tapped at least once and then remain released.
6. Press and release the PTO In-cab switch. The PTO telltale will blink rapidly.
7. Within 10 seconds press and release the cruise control resume (+) switch. The PTO indicator light will continue blinking rapidly until the load becomes engaged and then come ON steady. The engine rpm will advance to PTO Standby Speed if that is greater than the engagement speed. If the engine speed is above 1500 rpm when engagement is attempted the PTO load relay will not engage until the engine rpm moves below 1500.
8. Once engaged the engine speed will hold steady at the PTO Standby Speed setting. The desired engine speed can now be adjusted with the cruise control buttons or the accelerator pedal. The cruise set (-) and resume (+) buttons will operate similar to normal highway cruise operation to either tap up and down or ramp up and down. The desired engine rpm can also be captured with the cruse set switch and then fine-tuned by tap up and tap down operations.
9. After initial engagement, if the service brake must be applied, the engine rpm will drop and the PTO will not attempt to hold engine speed until it is again initiated [latched up] with the cruise Resume (+) switch. Once the resume (+) switch is pressed, the engine speed will slowly move to the last 'captured' speed.

**Notes:**

1. In Mobile PTO mode the vehicle speed achieved is the result of the current engine speed requested and the transmission gear range selected. When vehicle is placed in M2 or M3, the vehicle will upshift according to engine RPM set point, and vehicle speed will increase. To prevent upshifts and maintain lower vehicle speeds, place vehicle in M1.
2. Mobile mode [engine speed capture] is disengaged similarly to cruise control disengagement. See PTO System Disengage Conditions - Mobile Mode for more details.
3.11. PTO System Disengage Conditions

3.11.1. Stationary Modes [preset or variable] - in-cab control

To disengage PTO if one or more of the following actions are performed:

- Depress the brake pedal. The engine returns to base idle, but the PTO load relay remains engaged. The PTO Telltale will blink slowly indicating that a PTO Set Speed is still stored in memory. Upon releasing the brake, the factory default programming is for the engine speed to remain at curb idle. Pressing and releasing the Cruise Res + Switch will restore engine rpm to the last PTO Set speed. The PTO system can also be programmed to return engine rpm to the PTO Standby Speed setting.
- Depress the Cruise Cancel switch. The engine returns to base idle, but the PTO load relay remains engaged. The PTO Telltale will blink slowly indicating that a PTO Set Speed is still stored in memory. Activating the Cruise Res + switch, will restore engine rpm to the last PTO Set speed.
- Press and release the PTO in-cab switch. The PTO Load Relay will be disengaged, and engine returns to base idle. The PTO Telltale will turn OFF indicating the PTO Load Relay is disengaged and the stored set speed has been cleared from memory.
- Release Park Brake.

3.11.2. Stationary Modes [preset or variable] - remote control [with or without in-cab engage]

To disengage PTO perform any of the following actions:

- Open the PTO Remote Engine Start/Shutdown switch. Load Relay disengages, and engine will stop.
- Assert the PTO Emergency Stop Switch. Load Relay disengages, and engine will stop.
- Press and release the In-cab PTO switch. Stationary Modes will also disengage under the following conditions:
  - Vehicle movement is detected.
  - Park Brake is released.
  - Transmission is shifted out of PARK [P].
  - Ignition Key is cycled from “Run/Crank” to “Off” position.
  - PTO feedback signal is lost [load disengaged] if used. See full system schematic.
  - Cruise becomes ENABLED (Cruise ON/OFF switch pressed)
- Timed auto-engine shutdown: The timed auto-engine shutdown feature provides the means to shut down the engine automatically after a predefined time. PTO must be operational for this function to be active.

- Engine shutdown based on critical engine or PTO system fault conditions: The engine will be shut down when PTO is operating if a critical engine condition is detected by the vehicle system (i.e., low oil, low oil pressure, hot engine, hot transmission, low fuel, Diesel Particulate Filter (DPF) regeneration). If PTO operation is continued when critical engine conditions are present, a horn chirp warning will occur. The engine will shutdown 2 minutes after the horn warning. The operator can restart the engine with the ignition key or with the PTO remote engine start controls. The above horn warning and engine shutdown will again occur if the critical engine condition is still present. However, when ordering any Navistar Emergency Vehicle vocational sales applications, Automatic Engine Shutdown is disabled.

- Emergency Vehicle provisions for PTO are limited to the disabling the following Automatic Engine Shutdown conditions
  
  g) Low Fuel  
  h) Engine Coolant Hot  
  i) Transmission Fluid Hot  
  j) Low Engine Oil  
  k) Low Engine Oil Pressure  
  l) Diesel Particulate Filter Regeneration Warning

**Note:** Engine shutdown, based on critical engine or PTO system fault conditions could be disabled using the service tool for non-emergency application. “PTO Engine Shudown” Parameter needs to be programmed to “Disable” using service tool.

**Note:** When PTO remote engine starting has been initialized with the ignition key in the “Run” position, the Shift Lever will remain locked if the brake pedal is pressed and shift from Park is attempted while the engine is running and PTO is active (stand-by mode). At this point, a shift to Park will not be allowed until one of the following actions is taken by the vehicle operator:

- Press the PTO Remote Engine Start/Shutdown
- Press and release the in-cab PTO switch
- Press Cruise Cancel or toggle the Cruise Control switch to ON
- Release Park Brake
3.11.3. Mobile Mode

To disengage PTO if one or more of the following actions are performed:

- Depress the brake pedal. The PTO system releases control of engine speed, but the PTO load relay remains engaged (if configured). Engine will return to base idle unless the accelerator pedal is depressed. The PTO load relay remains engaged. The PTO Telltale will blink slowly indicating that a PTO Set Speed is still stored in memory. Upon releasing the brake, the factory default programming is for the engine speed to remain at base idle awaiting a press and release of the Cruise Res + Switch which will restore engine rpm to the last PTO Set speed. The system can also be programmed to return engine rpm to the PTO Standby Speed setting. Speed is still stored in memory. Upon releasing the brake, the factory default programming is for the engine speed to remain at curb idle awaiting an input from the Cruise Res + Switch to restore engine rpm to the last PTO Set speed. The system can also be programmed to return engine rpm to the PTO Standby Speed setting.

- Press and release the Cruise Cancel switch. The engine returns to base idle; but the PTO load relay remains engaged. The PTO Telltale will blink slowly indicating that a PTO Set Speed is still stored in memory. Pressing and releasing the Cruise Res + switch, will restore engine rpm to the last PTO Set speed.

- Press and release the PTO in-cab switch. PTO will be disengaged with the initial ‘press’ of the switch and engine speed will return to base idle. The PTO Telltale will go OFF indicating the PTO Load Relay is disengaged and the stored set speed has been cleared from memory.

Mobile Mode will also disengage if any of these actions or events take place:

- PTO feedback input is lost [load disengaged] if configured.
- Vehicle Speed exceeds Max Vehicle Speed. Factory default setting = 58 MPH
- Engine Speed exceeds Max Engine Speed for greater than 15 seconds. Factory default setting = 2100 rpm.
- The Cruise Control On/Off switch is toggled to ON.
- The Park Brake is applied.
- The Transmission Shift Lever is moved out of manual shift selection [M1, M2, and M3].

Notes:

1. Resume memory speed is cleared for the above actions.
2. Although the PTO system attempts to limit accelerator and PTO switch inputs to comply with maximum speed and /or rpm parameters, some
vehicle operating conditions such as downhill acceleration can cause the vehicle speed or engine rpm to exceed these limits and in those cases the PTO system may disengage.

3.12. Prolonged or Extended PTO Operation

Warning:

While operating your vehicle in stationary PTO mode, the Diesel Particulate Filter (DPF) will continue to filter the exhaust and accumulate soot. The engine control system, depending on the speed and load being applied by the PTO, may not be able to generate enough energy or adequate heat needed to clean or regenerate the DPF. Continued operation under conditions that do not allow effective regeneration or cleaning will eventually plug the DPF and result in reduced power. The ENGINE POWER IS REDUCED Driver Information Center (DIC) message and Malfunction Indicator Lamp will be displayed, and dealer/retailer service will be required to return your vehicle to normal, full power operation. To prevent this from occurring, frequently monitor your vehicle during PTO operation, paying particular attention to the CLEAN EXHAUST FILTER SEE OWNER MANUAL NOW DIC warning message or any horn chirps if operating PTO remotely. If the DIC message [or horn chirp] is presented during PTO operation, see OWNER MANUAL Diesel Particulate Filter for information on how to clean or regenerate the DPF.

3.12.1. Diesel Particulate Filter [DPF] Cleaning during Stationary PTO Operation

If the DPF becomes sufficiently loaded with soot during a PTO session the system will issue a DIC warning message and **horn chirps** as notification to the operator. If the operator is outside the vehicle [remote operation] he must return to the cab and, if running in ‘key out’ mode, insert and rotate the key to the ‘run’ position to respond to the system messages. [Messages are not displayed unless the key is in the ‘run’ position.]

**Notes:**

- Manual DPF [cleaning] regeneration can be initiated during a PTO idle up session.
- It is strongly recommended that the exhaust filter be cleaned before continuous PTO usage if possible.
- If a manual regen is initiated during the PTO session the PTOM will retain control of the engine speed and the selected speed will not change as the regen event initiates.
- Low PTO engine speeds and light loading will cause regeneration to take longer.

To initiate a manual DPF regeneration, see “Manual Regeneration of Diesel Particulate Filter” under Diesel Particulate Filter in the Duramax Diesel Supplement pamphlet in the glove box. See UI Bulletin xxx DPF Regen for more detail.
Warning:
The exhaust system and exhaust gases get very hot during a manual regeneration. Things that burn could touch hot exhaust parts under the vehicle and may catch fire. You or others could be burned. Do not leave the vehicle unattended during a manual regeneration. If operating from outside the vehicle maintain a safe personal distance away from the hot exhaust or you could be burned.

Warning:
Engine exhaust contains Carbon Monoxide (CO) which cannot be seen or smelled. Exposure to CO can cause unconsciousness or even death. Never operate PTO in an enclosed area such as a garage or building that has no fresh air ventilation. See “Engine Exhaust” in the Vehicle Owner Manual.

Warning:
If the key is in the ignition during Remote PTO operation, the vehicle can be shifted out of Park by an operator. Even though PTO will be disengaged, depending on PTO Truck Equipment Manufacture (TEM) application, personal injury or property damage may result from vehicle movement. Always remove key from the ignition before operating Remote PTO.

3.13. PTO Operational Speed Control
3.13.1. [Variable] PTO operational speed control provides the following functions:
Cruise Set - Switch (In-cab) or Remote PTO Tap Down switch

- **SET**: [in cab operation] - press and hold the accelerator to obtain the desired engine speed, then press and release the Set - position on the Cruise Switch. The current engine speed will be maintained. This action can be repeated as desired to a higher rpm value. The PTO set speed cannot exceed 2900 rpm (Mobile PTO only).

- **TAP-DOWN**: Press and release the Set - switch position on the Cruise Switch to reduce the engine speed by increments of 100 rpm. The TAP-DOWN Engine Speed increments can be adjusted by Navistar CV vehicle service tool. The Service Tool can enable the option for adjustment of TAP-DOWN Engine Speed increments via Radio Customization menu.

- **COAST**: Press and hold the Set - switch position on the Cruise Switch to reduce the rpm at 150 RPM per second until the desired engine speed is reached or until the initial PTO standby speed is reached.

3.13.2. In-cab Cruise Res + Switch (or Remote PTO Tap Up switch)

- **RESUME**: After a PTO set speed has been achieved during PTO operation, a “RESUME SPEED” is retained after an application of the
brake pedal. Engine speed will reduce to basic idle speed. The PTO Telltale will blink slowly indicating the previous PTO set speed has been retained in memory. Press and release the Res + switch position on the Cruise Switch to resume the previous PTO set speed.

- **TAP-UP:** Press and release the Res + position on the Cruise Switch to increase the engine speed by increments of 100 rpm (factory present value). The TAP-UP Engine Speed increments can be adjusted by the Navistar CV vehicle service tool. The Service Tool can enable the option for adjustment of TAP-UP Engine Speed increments via Radio Customization menu.

- **ACCEL:** Press and hold the Res + position on the Cruise Switch to increase the rpm by 150 rpm per second until the desired engine speed is reached or until the maximum allowable PTO set speed is reached. Alternatively, the engine speed acceleration can be adjusted via the Radio Customization menu.

### Table 4.4.2: Factory Preset Parameters
(The following table lists the factory preset parameters. These may be altered by a Navistar CV vehicle service tool to configure the various PTO features.)

Navistar Electrical Systems CV Integration Guide Page 34 of 84 Revision Date: 9/12/2019
If the PTO factory preset parameters do not match the settings described above, then they may have already been altered in order to satisfy the requirements of the installed PTO system and body equipment.

The following PTO Settings are also offered via the vehicle customization screens, which can be enabled by your service technician. These include the following parameters:

- PTO Standby RPM
- PTO Set 1 Speed
- PTO Set 2 Speed
- Tap Step
- PTO Engine Run Timer

Red * = parameter not programmable for Emergency vehicle provisions for PTO
3.14. Driver Information Center (DIC) Warnings Messages

If the PTO telltale does not remain on (i.e. goes out after one second), this indicates that not all PTO enabling condition/s have been satisfied. In the case, one or more of the following Driver Information Center (DIC) messages may appear on the instrument panel cluster if the PTO will not engage. The operator must take the action indicated, then again attempt to re-enable PTO.

- PTO: SHIFT TO PARK (P) (Stationary only)
- PTO: SET PARK BRAKE (Stationary only)
- PTO: PRESS & RELEASE BRAKE (Mobile only)
- PTO: RELEASE BRAKE TO ENGAGE PTO
- PTO: REDUCE VEHICLE SPEED
- PTO: REDUCE ENGINE SPEED
- PTO: DISENGAGE CRUISE CONTROL

In addition to these messages, the PTO telltale will indicate when all conditions required to engage PTO have not been met. When enabling PTO, the PTO telltale will turn on, then turn off after one second. Under normal operating conditions, the PTO telltale will remain on throughout the PTO operating cycle.

Additional in-vehicle PTO module information can be accessed by the service technician to aid in troubleshooting. Also see service manual for more information.

The Navistar service technician can access service tool information which will contain reasons why PTO may not engage as well as reasons pertaining to why the PTO may unexpectedly disengage due to particular system/s conditions.

3.15. Appendix: PTO, Remote Engine Speed Control, and General Safety Recommendations

Table 4.14.1: Appendix Notes on Power Take Off Operation and Safety

<table>
<thead>
<tr>
<th>No.</th>
<th>Safety Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PTO Feature has several characteristics that can be changed by configuration. Check all configuration selections carefully to avoid inadvertently deactivating safety mechanisms or impacting performance.</td>
</tr>
<tr>
<td>2</td>
<td>Truck Equipment Manufacture’s (TEM’s) choice of components may affect performance. Even when system safety is available the overall performance of the system may be adversely affected by use of an improperly selected component or not following the recommended mechanization. The PTO System’s safety mechanisms are designed to interrupt PTO operation in the event of a detected fault in related components or wiring.</td>
</tr>
<tr>
<td></td>
<td>The PTO safety mechanisms designed and built into the vehicle have been created by Navistar to cover PTO System operation only, which can include automatic engine shutdown to prevent unintended vehicle movement and protect the engine, transmission and PTO from damage. The PTO System should not be used for life support operations or an emergency back-up power source. Safety and function of all equipment added by the Truck Equipment Manufacture (TEM) to the vehicle is the responsibility of the TEM. TEM is responsible for compliance to applicable occupational health and safety standards, industrial safety standards or regulatory requirements.</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>3</td>
<td>Stationary Remote mode is not intended to operate with the vehicle's hood open. PTO system operation is terminated if the hood is opened during stationary operation.</td>
</tr>
<tr>
<td>4</td>
<td>Stationary Remote Mode is not intended to be operated with the ignition key in place.</td>
</tr>
<tr>
<td>Component</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Remote Arm Switch</td>
<td>N.O. Momentary Contact</td>
</tr>
<tr>
<td>PTO Remote Engine Shutdown/Start Switch</td>
<td>N.C. Momentary Contact</td>
</tr>
</tbody>
</table>

Poor quality switches may not always activate switch contacts properly when pushed, resulting in a 'no start' when starting, or a 'no stop' when requesting a shutdown.
### Pendant Enable Switch

<table>
<thead>
<tr>
<th>J &amp; K</th>
<th>N.C. Latching Contacts DPST Switch</th>
<th>Remote Pendant Connect/Disconnect</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Switch must be OFF when Pendant is removed. Only close after Pendant is reconnected</td>
<td>Erratic signals to the control module are avoided during the reconnectio n of the Pendant</td>
</tr>
</tbody>
</table>

Switching off the pendant will ensure that there is no faulty contact that will pull the remote start line high when the pendant is reattached. This switch must be selected carefully to ensure proper performance and sufficient durability in the intended Truck Equipment Manufacture (TEM) application.

### Engine Kill

<table>
<thead>
<tr>
<th>A</th>
<th>N.C. Contact 'A</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Engine Kill</td>
</tr>
<tr>
<td></td>
<td>Notifies PTO System that PTO disengagement and engine shutdown are required</td>
</tr>
</tbody>
</table>

This device is required to support an emergency shutdown initiated from outside the vehicle and in the vicinity of the remote location, prominently visible and easily accessible, should it become necessary. Other shutdown mechanisms (e.g., in-cab ones) may be located a significant distance from the remote panel, impacting the operator's ability to initiate an emergency shutdown, if needed, quickly if this button is not added to the TEM's equipment design. This switch must be selected carefully to ensure proper performance and sufficient durability in the intended TEM application.

### Emergency Stop Button

<table>
<thead>
<tr>
<th>R</th>
<th>N.C. Contact 'B</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>IGN 1 (Run / Crank)</td>
</tr>
<tr>
<td></td>
<td>Initiates immediate disengagement of PTO and shutdown of vehicle's engine</td>
</tr>
</tbody>
</table>

PTO System opens PTO Relay to disengage PTO (redundant disengagement) and notifies PTO System that PTO disengagement and engine shutdown are required. It is recommended that an Industry Standard Emergency Stop button be used, large in size and red in color, with two fixed positions: When pushed to the fixed 'in' or 'stop' position an Emergency Stop has been commanded: when returned to the fixed 'out' position normal operation will return, enabling a subsequent start request to be accepted. Poor quality switches may activate inadvertently under vibration resulting in unwanted shutdowns or, if stuck in the 'out' position, prevent shutdown.

Initiates immediate disengagement of PTO and shutdown of vehicle's engine. Poor quality switches may activate inadvertently under vibration resulting in unwanted shutdowns or, if stuck in the 'out' position, prevent shutdown.
## Localized Power for Truck Equipment Manufacture (TEM)

To use in powering added external circuitry

<table>

### Engine Speed Controls

- **Point to Point (High/Low)**
- **Variable Speed Control**

### PTO System

- **PTO System accepts and implements the speed change request**
- **This device, switch or potentiometer depending on the alternative chosen, sets / controls engine speed**
- **The PTO System limits the maximum rate of change of engine speed during the transition to the newly selected speed.**

### Failure of Device

- **Failure of this device may result in the inability to set or change speed, or in speed changing inadvertently resulting in operator / customer annoyance.**
- **This device must be selected carefully to ensure proper performance and sufficient durability in the intended TEM application.**

### Relay Failure

- **Failure of this device may result in the inability to set or change speed, or in speed changing inadvertently resulting in operator / customer annoyance.**
- **The relay must be selected carefully to ensure proper performance and sufficient durability in the intended TEM application. Poor quality responses, if this device fails too often this may result in safety responses occurring.**

### Relay Fault

- **Relay failure will be detected by the PTO System.**
- **Relay failure will be detected by the PTO System.**

### Fault Code

- **Must not be tied to ground or power or a diagnostics fault code will be set, and PTO functionality will be locked out until the fault is cleared.**

### PTO Engage Relay

- **PTO Engage Relay Coil Terminal 1**
- **PTO Engage Relay Coil Terminal 2**

### PTO Engage Relay

- **PTO Engage Relay High**
- **PTO Engage Relay Low**

### PTO Engage Relay

- **All Modes and Configurations Balanced drive used to eliminate the possibility that a short circuit in wiring could be detected by the PTO System.**

### Remote Control Devices

- **Remote Control Devices (High/Low)**
- **Remote Control Devices (Variable Speed Control)**

### Engine Speed Controls

- **Engine Speed Controls**
- **Engine Speed Controls**

### PTO System

- **PTO System accepts and implements the speed change request**
- **This device, switch or potentiometer depending on the alternative chosen, sets / controls engine speed**
- **The PTO System limits the maximum rate of change of engine speed during the transition to the newly selected speed.**

### Failure of Device

- **Failure of this device may result in the inability to set or change speed, or in speed changing inadvertently resulting in operator / customer annoyance.**
- **This device must be selected carefully to ensure proper performance and sufficient durability in the intended TEM application.**

### Relay Fault

- **Failure of this device may result in the inability to set or change speed, or in speed changing inadvertently resulting in operator / customer annoyance.**
- **The relay must be selected carefully to ensure proper performance and sufficient durability in the intended TEM application. Poor quality responses, if this device fails too often this may result in safety responses occurring.**

### Relay Fault

- **Failure of this device may result in the inability to set or change speed, or in speed changing inadvertently resulting in operator / customer annoyance.**
- **The relay must be selected carefully to ensure proper performance and sufficient durability in the intended TEM application. Poor quality responses, if this device fails too often this may result in safety responses occurring.**

### PTO Engage Relay

4. Fast Idle Control – Engine Speed Control L/PTO

4.1. To obtain Fast Idle capability you must order the following options:
   1) HS Series Transmission – 13AWX, 13AXB, 13AXG, 13AXR
   2) Fast Idle option – 12WGJ, THROTTLE, HAND CONTROL Engine Speed Control L/PTO

Figure 5.1.1: NOTE: Fast Idle (RPO: UF3) can be added by the dealer at extra cost.

Figure 5.1.2: Steering Wheel Controls

Fast Idle is controlled using the Cruise Control buttons located on the left-hand side of the steering wheel.

Required Initial Conditions
These conditions must be met for Fast Idle to work:

1. Park Brake must be set
2. Transmission/PRNDL must be in Park (P) or Neutral (N).
3. The Brake must not be pressed.
4. Vehicle Speed must be zero.
4.2. Enable (Turn ON) Fast Idle
After the Required Initial Conditions above have been met, you can Enable Fast Idle by pressing and releasing the Cruise Control “ON” switch, the LED indicator on the switch will illuminate.

4.3. Preset Fast Idle
After the Required Enable Conditions [delineated above] have been met, you can engage Fast Idle by pressing and releasing the Cruise Control “SET” switch to achieve the single preset fast idle speed of 1000* or 1200* rpm *depending on vehicle model, year and engine application

Disable (turn off) Actions
Any of these conditions will cancel Fast Idle:

1. Turn Cruise Off. Press and Release the Cruise Control “ON/OFF” switch.
2. Press and Release the Cruise Control “SET” switch while in high idle.
3. Press the brake pedal.
4. Press and Release the Cruise Control “CANCEL” switch.
5. Release the Park Brake.
6. Move the Transmission Shift Lever (PRNDL) from Park (P) or Neutral (N).
7. Apply the accelerator pedal greater than 25%

4.4. Adding Fast Idle (UF3)
Adding the Fast Idle (12WGJ) feature is accomplished by reprogramming the Vehicle’s Body Control Module (BCM). Navistar Dealers can acquire a new Vehicle Configuration Index (VCI) by contacting Techline Customer Support Center (TCSC). A support center consultant will create the new VCI with UF3 option as part of the vehicle option content.

Note:
TCSC typically imposes an administrative fee on the dealers requesting the updated VCI and this fee may be passed onto the customer. This fee is in addition to the labor charges for the reprogramming of the vehicle.

The newly created VCI is readily available for use in the reprogramming of the vehicle’s BCM. Dealers simply need to perform a programming event on the BCM to now add the feature/option.

Reminders:
- The feature’s operation and control functions: Once the feature’s aspects have been added to the vehicle, further information can be found in the subsequent section of this document.

5. Truck Equipment Manufacture (TEM) Auxiliary Switches
Applicable with Navistar CV Trucks, built with the regular production option (auxiliary switch bank) replacement for the standard switch bank located just below the Climate Controls (refer to figure 1). The intent of this switch pack is for the control of
features/functions from inside the cab. The auxiliary switch positions and, or locations is contingent on the body builder integrated equipment as well as the available space in the auxiliary switches.

These switches are configurable to provide either Battery or Ignition (Run/Crank) 12v+ outputs. The configuration is accomplished by the **RELOCATION** of two fuses in the both the LH and RH Fuse blocks. The configuration for battery or ignition is done in pairs. Fuse placement will provide battery or ignition activation of the output relays for Button Positions 4 and 5* or Button Positions 6 and 7*, depending on the locations of the two fuses.

**NOTE:** Vehicles can **NOT** be retrofitted post production to include this option.

5.1. Switches/Relay outputs:

**Figure 6.1.1: Truck Equipment Manufacture (TEM) Auxiliary Switches**
Figure 6.1.2: Truck Equipment Manufacture (TEM) Auxiliary Switches

![ TEM Auxiliary Switches Diagram ]

The outputs from the switches are located inside the cab into the LH IP Junction Block

Note: The **yellow** shaded terminals are available signals for Truck Equipment Manufacture (TEM) usage.
NOTE: The **RED** squared area in Figure 6.1.6. reflects the factory default (battery powered) locations for Button Positions 4 and 5*. The **BLUE** squared area in Figure 5 reflects the reconfigured (Ign. Run/Crank powered) locations for Button Positions 4 and 5*

To reconfigure Button Positions 4 and 7* to operate only when the ignition is in the Run/Crank mode, simply relocate the 5-amp fuse from location 18 to that of location 5.

**NOTE:** do **NOT** populate both fuse 5 and fuse 18 locations at the same time.

NOTE: The **RED** squared area in Figure 6.1.6. reflects the factory default (battery powered) locations for Button Positions 6 and 7*. The **BLUE** squared area in Figure 6.1.6. reflects the reconfigured (Ign. Run/Crank powered) locations for Button Positions 6 and 7*.

To reconfigure Button Positions 6 and 7* to operate only when the ignition is in the Run/Crank mode, simply relocate the 5-amp fuse from location 3 to that of location 6.

**NOTE:** do **NOT** populate both fuse 3 and fuse 6 locations at the same time.
Figure 6.1.8: Wire Harness Pass-thru location

Figure 6.1.8 shows the location of the Truck Equipment Manufacture (TEM) wire harness pass through.
5.2. Wiring Schematic

Figure 6.1.9: Truck Equipment Manufacture (TEM) Provisions at Junction Block - Instrument Panel (8XJP)

6. Auxiliary Battery Connections

**Note:** Frequent field issues have been encountered with systems that move the OEM under-hood battery. Issues such as frequent Diagnostic trouble codes, improper transmission controller operation [rough shifting and clutch slip problems] as well as intermittent no crank issues have been reported. In many cases, the issue is resolved by restoring the OEM battery and cables to factory arrangement.

6.1. Repair/Recommendation:
Relocation of the OEM under-hood battery should be avoided whenever possible. The following guidelines are offered for issue resolution.

1. For 2016 and newer units, the Navistar recommended auxiliary battery configuration is the factory option TP2 - Battery, 600 cold-cranking amps primary, isolated 2nd heavy-duty 770 cold-cranking amps which allows 2nd
battery to be used when the vehicle is not running without affecting ability to start the vehicle.

2. If remote batteries are required [ex: tray batteries] – see ‘additional Information’ below.

6.2. Additional Information:

Batteries may be located outside the engine compartment. When this is done the following is recommended:

Negative Cable Recommendations:

[a] The first and “most recommended” method for remote battery negative cabling is a jumper cable between the battery terminals with a single ‘home run’ cable directly to the engine block.

[b] An alternate - less recommended - method is using the frame as part of the negative cable path. When this is done it is essential that appropriate sized cables are used. The cable from the tray battery negative terminals to the frame and the cable from the frame to the engine block [or a transmission-to-engine mounting bolt] should be the same gauge.

[c] Welded studs - added to the frame - are recommended for the two required connection points. [The frame bolt-clamping connection method presents multiple failure modes and is not recommended.]

[d] The OEM negative battery cable will be too small for re-purposing to this task.

Note: It is essential that the negative ground return path is not compromised. Merely grounding the tray batteries to the frame WILL NOT WORK. Extra care must be used to assure adequate current flow path to the engine/transmission castings. The high current path is from the battery negative terminal to the starter motor casting. The engine block is main ground and the frame and body are secondary. The OEM frame grounding is not sufficient if the frame is used as ‘part of the negative battery cable.’ and the additional cable to the engine/trans casting is required for this case. The body grounding cable must be maintained in all cases.

6.2.1. Positive Cable Recommendation.

[a] The first and “most recommended” method for remote battery positive cables is a jumper between the battery terminals with a single main ‘home run’ cable to the starter motor solenoid terminal.
[b] Connections to generators and main electrical center should be made at the starter motor solenoid [most recommended].

c] If the stacking of multiple cables on the starter solenoid stud is a problem a single main cable to a junction block may be indicated. The junction block can facilitate the required connections for the generator[s] and main electrical center.
Figure 7.1: Remote Battery Connections Schematic
7. Rearview Camera Installation

Note: Navistar Dealers and truck equipment manufactures requiring instruction and guidelines on the installation of review cameras on Navistar CV vehicles. The following are guidelines intended to assist with the installation process. Furthermore, compliance to all FMVSS rules and regulations are the strict responsibility of the camera system integrator.

7.1. Mounting the Camera

Fabrication of brackets and, or mounts for the mounting of the camera is the responsibility of the truck equipment manufacture. Mounting location should be determined by case by case to maximize the field of view and mage display quality requirement set forth by the National Highway and Transportation Safety Administration (NHTSA). The NHTSA has publish test procedures available which may be downloaded to aid in establishing a mounting location that meets the standards. https://www.nhtsa.gov/

2019 and later Navistar CV vehicles: It is the truck equipment manufacture’s responsibility to ensure FMVSS111 regulatory adhearance.

Regular Production Option (RPO) UVC provides the following content for facilitating the installation of a rear-view camera.

- Rear camera calibration installed at assembly plant
- One camera unit complete with pigtail wiring
- Fixed zero pitch mounting bracket
- One wire harness extension

Note: These components are all shipped inside the vehicle cab

7.2. Camera Installation Guidelines

- Install camera into the provided mounting bracket using the provided two screws (not shown bu included).
- Optimal position for the camera (using the included OEM bracket) is the centerline of the vehicle at a height of 38” off the ground, with zero-inch set-back from the rear most portion of the vehicle/body.
- An allowable distance of two inches off the centerline of the vehicle and no more than a range of 24” to 48” off the ground with a set-back distance of no more than eight inches from the rear of the vehicle/body represents the maximum distances with which the OEM bracket is capable of meeting the requirements defined in FMVSS111. Note: by increasing the set-back distance from the rear of the vehicle this additional distance will result in the increase in the vertical range of the camera.
- Other mounting locations and stragies requiring a different camera mounting solution shall be the responsibility of the camera system installer.
Figure 8.1.1: Camera Extension Harness, Mounting Bracket

- Extension harness
- Mounting Bracket (Includes 2 not shown screws for securing camera to bracket)
- Camera w/pigtail
**Note:** Vehicles not ordered/manufactured with the UVC option currently cannot be retrofitted as chassis wiring provisions are not provided without the option being present at the time of the vehicle build.

8. **Infor – Radio Telephone/Mobile radio (Transceiver) Installation and troubleshooting Guidelines**

The following information is being provided to assist in the installation and troubleshooting of radio telephone/mobile radios.
Certain radio telephones or land mobile radios also known as radio transceivers), or the way in which they are installed, may adversely affect various vehicle operations such as engine performance, driver information, entertainment and electrical systems.

Expenses incurred to protect the vehicle systems from any adverse effects of any such installation are not the responsibility of Navistar Corporation.

The following are general guidelines for installing a radio transceiver in Navistar vehicles. These guidelines are intended to supplement, but not to be used in place of, detailed instructions which are the sole responsibility of the manufacturer of the involved radio transceiver. Although this document refers to passenger vehicles, the same general guidelines apply to trucks.

**Important:** Refer to the illustrations found later in this bulletin for aid in installation.

### 8.1. Transceiver Location

- Locate transceiver for remote radios on driver’s side of trunk as near to the vehicle body side as possible.
- One-piece transceivers should be mounted under the dash or on transmission hump where they will not interfere with vehicle controls or passenger movement.
- Great care should be taken not to mount any transceivers, microphones, speakers or any other item in the deployment path of a Supplemental Inflatable Restraint (air bag).

### 8.2. Antenna Installation

- Each vehicle model and body style reacts to radio frequency energy differently. When dealing with an unfamiliar vehicle, it is suggested that a magnetic-mount antenna be used to check the proposed antenna location for unwanted effects on the vehicle. Antenna location is a major factor in these effects.
- The antenna should be a permanent-mount type located in the center of the roof or center of the rear deck lid. Glass mounted antennas should be kept as high as possible in the center of the rear window or windshield. If a magnet-mount antenna is used, care should be taken to mount the antenna in the same location as a permanent-mount type. If a disguise-mount antenna is used, great care should be taken to shield any tuning network from vehicle electronics and wiring, or to mount the tuning network in an area completely clear of vehicle electronics and wiring.
- Standard metal mount antennas may be mounted on a vehicle with nonmetallic body panels by two methods. Most nonmetallic skinned vehicles have metal frames underneath. Mounting the antenna near a
metal frame section and bonding the antenna mount to the frame with a short metal strap will provide the ground plane connection. Some antenna manufacturers offer “ground plane kits” that consist of self-adhesive metal foil that may be attached to the body panel to provide the ground plane for the antenna.

- Some vehicles use glass that contains a thin metallic layer for defrosting or to control solar gain. Glass mount antennas will NOT function when mounted on this type of glass.
- If RF-related interactions occur when using a hitch or bumper-mount HF antenna on a vehicle that has body on frame construction (i.e. pickup, SUV) connect a ground strap from the vehicle frame to the bottom rear of the vehicle body (for station wagon type vehicles), or from the vehicle frame to the bottom rear of the cab (pickup style vehicles).

8.3. Antenna Cable Routing

- Always use a high-quality coax (at least 95% shield coverage) located away from the engine control module (ECM) and other electronic modules.
- Care should be taken to maintain as great a distance as possible between any vehicle wiring and the feed line.

8.4. Antenna Tuning

It is important that the antenna be tuned properly and reflected power be kept to less than 10% (VSWR less than 2:1).
8.5. Radio Wiring and Connection Locations

- Connecting radio power on Navistar vehicles is model dependent. The installer must decide which one of the following four methods will be appropriate.
  - Connect the positive and negative leads directly to the battery terminals (illustrated in this guideline).
  - Connect the positive lead to the auxiliary power terminal (located at the under-hood fuse center or identified by a red plastic cover in the under-hood area) and connect the negative lead directly to the negative battery terminal.
  - Connect the positive lead to the auxiliary power terminal and connect the negative lead to the battery body connection point (identified by a short #10 AWG or larger wire running from the negative battery terminal to the body of the vehicle).
  - Connect the positive and negative leads to the Special Equipment Option (SEO) wiring provided for this purpose.

- If connections are made directly to the battery terminals, the Navistar-approved methods of connecting auxiliary wiring include the adapter package illustrated in Figure 2, NAPA-Belden replacement battery bolts, P/N 728198, or drilling and tapping the hex end of the original battery bolts 10-32 X 3/8” deep. Note that it is recommended that a fuse be placed in the transceiver negative lead to prevent possible transceiver damage in the event the battery-to-engine block ground lead is inadvertently disconnected.

- For ONE-PIECE TRANSCEIVERS where ignition switch control is desired, and no SEO wiring exists, a 12volt power contactor must be installed in the transceiver positive lead. The contactor should be located near a proper 12volt feed. The coil of the contactor should be connected through an appropriate in-line fuse to an available accessory circuit or ignition circuit not powered during cranking. The contactor coil must return to a proper negative point. The detailed view in Figure 1B illustrates direct connection to the vehicle battery.

- Any negative lead from a handset or control unit must return to a proper negative connection point. It is preferable that the positive lead for a handset or control unit be connected directly to a proper positive feed. If ignition switch control is desired, the handset or control unit positive lead may be connected through an appropriate in-line fuse to an available accessory circuit or ignition circuit not powered during cranking. It is recommended that the handset or control unit positive and negative leads be appropriately fused separately from the transceiver positive and negative leads.

- If multiple transceivers or receivers are to be installed in the vehicle, power leads to the trunk or under dash should be connected to covered, insulated terminal strips. All transceivers or receivers may then have their
power leads connected to the strips. This makes a neater installation and reduces the number of wires running to the vehicle under hood area.

8.6. Radio Wire Routing

- The power leads should be brought through a grommet hole in the front bulkhead that must be provided by the installer. For trunk-mounted transceivers, the cables should continue on along the driver’s side door sills, under the rear seat, and into the trunk through the rear bulkhead. All attempts should be made to maintain as great a distance as possible between radio power leads and vehicle electronic modules and wiring.
- If the battery is located on the passenger side, radio power leads should cross the vehicle in front of the engine.

8.7. Troubleshooting

- Should vehicle-radio interaction develop following installation, the source of the problem should be determined prior to further operation of the vehicle. Most interaction problems can be eliminated by following the installation guidelines.
- If any vehicle-radio interaction problems exist after following these guidelines, refer to the EMC Troubleshooting Chart at the end of this bulletin.

**Note:** During the upfit process it may, for various reasons, become necessary to remove or relocate certain electrical connections, components and/or control modules. The following are the best practices/guidelines as they pertain to these types of components

**Safety Systems:**

Be advised that the components for the following systems…Air Bag, Anti-lock Braking, Collision Avoidance, Obstacle Detection Lane Departure and Blind Spot Warning cannot be relocated as the systems are calibrated to their location within and to the vehicle.
Electrical Components (non-safety system related)
When relocating electrical components careful consideration needs to be given as to environmental conditions of the new location. Such things such as moisture, temperature, electromagnetic interference, signal interference/impediment.

9.1. Under-hood/Vehicle:
When relocating components outside the passenger compartment of the vehicle steps to protect the device/component from high heat sources such exhaust system, engine block, cooling system and their associated parts/sub-assemblies.
Consideration to the possibility of water/moisture intrusion must also be given, many outside areas of the vehicle are often subject to water splash and/or spray so the components must be protected by a water tight housing with proper weather protected connector and seal assemblies. Consideration to all moving parts/components is required when selecting a new location.

9.2. Under-dash:
Components being considered for relocation inside of the passenger component need to have the same environmental considerations given as to the selected location. Components to be mounted under dash/above the driver/operator foot controls must secured so not impose a risk of dislodging and impeding the operation of any of the vehicles foot controls. Under dash mounting must also not impede the operation of any of the vehicles sub-systems.

9.3. Doors:
When relocating components within the doors consideration to moving parts and environment. When considering a new location for component/s be aware of the travel path of the moving window and its components. Also, being sure not to impact any of the door latching/release systems. Additionally, reinstallation of the door’s water deflection system/shields is required to prevent water intrusion inside the vehicle. Electrical system components should never be relocated to the "wet" side of the water deflection system. To prevent water intrusion into components inside of the door, connector interfaces should always be positioned in a downward orientation. It is also suggested that wire harnesses be routed with a drip loop near or at the device whenever possible.

9.4. Under Seats:
When relocating components under or near the seats consideration shall be taken regarding all moving parts and their subsequent environments. When considering a new location for component/s be aware of the travel path of the moving seat and its components. Also, being sure not to impact any of the seat’s latching/release systems. Many front driver and passenger seats have integrated safety components that too must not be interfered with as well. Consideration to the seat belt system and its moving and latching system must also be given.

9.5. Rear Stowage Areas:
When relocating components under or near the seats consideration shall be taken regarding all moving parts and their subsequent environments. Additionally, once again environment must consider when mounting or locating a device in this area to the “drip zone” of water/moisture dripping off the rear stowage area enclosure. Be sure that when the enclosure
is opened that any water or moisture that may be on the enclosure won’t drip onto the mount device/components.

9.6. General Recommendation:
Lastly, consideration shall be given to all possible impacts to the vehicle’s operator and occupants when adding or relocating electrical devices.

10. Appendix - General Electrical Section:
Description - International vehicle electrical systems are becoming increasingly complex with the addition of a BC, electronic engine and transmission controls, electronically driven instrument gauges, and Antilock Brake Systems (ABS) to name a few. While most systems still operate on battery voltage (12volts), some systems operate at as high as 107 volts (electronic fuel injection) and as low as five (5) volts (electronic engine controls).

International publishes Electrical Circuit Diagram Manuals for all its models. Body builders and installers should refer to these manuals before connecting body lights and accessories to the vehicle electrical system to assure that circuits chosen are both appropriate and not overloaded. Modifications not defined in the circuit diagram book are not to be made to the vehicle electrical/electronic control systems without first contacting International for assistance at its Tech Central Department, telephone 1-800-336-4500.

10.1. Color Code System for International® Truck Wiring:

Wiring Color Code System:

<table>

NOTE - ANY UNUSED CIRCUIT CAVITIES MUST BE PLUGGED WITH SEALING PLUGS PROVIDED WITH CHASSIS HARNESS.

Commonly Used Electrical Integration Small Components Table

10.4. Wire Splicing and Termination - Standard Terminals and Splices:

**Standard Terminals**
1. Cut the cable just before the insulation wings on the terminal.
2. Remove the insulation being careful not to cut any of the wire strands.
3. Position cable in the new terminal.
4. Hand crimp the core wings first, then the insulation wings.

NOTE - Always use the recommended crimp tool for each terminal. A detailed crimp chart is included in the repair kit.
5. Solder all hand crimped terminals and electrically check for continuity.

**Splice Clip Installation**

**NOTE** - A new clip must be located a minimum of 1.5 inches (40 mm) from a connector, sleeve or another clip.

1. Cut off the old clip or bad section of wire.

2. Remove the insulation being careful not to cut any of the wire strands.

3. Install the proper clip on the wire strands.

4. Hand crimp the clip until securely fastened.

5. Solder the clip and electrically check for continuity.

6. Cover the entire splice with splice tape. Extend the tape onto the insulation on both sides of the splice(s).

<td>50</td>
</tr>
</tbody>
</table>

**NOTE** - A new sleeve must be located a minimum of 1.5 inches (40 mm) from a connector, clip or another sleeve.

1. Cut off the old sleeve or bad section of the wire.
2. Remove insulation being careful not to cut any of the wire strands.
3. Install the proper sleeve on the wire strands, making sure the ends of the wire hit the stop.
4. Hand crimp to the sleeve. Gently tug on the wire to make sure that they are secure.

**NOTE** - Always use the recommended crimp tool for each sleeve. A detailed crimp chart is included in the Repair Kit.

**CAUTION** - Use appropriate heat gun. Do not use a match or open flame to heat the sleeve seal.

5. Electrically check the sleeve and wire cable for continuity.

Data Link Repair:
J1939/11 Shielded Only
Repairs to damaged J1939 circuits should be accomplished using identical types of wiring. Splices should be crimped, soldered and covered with heat shrink. Insure the twist in the wire pair is maintained and that any wire bundles in the engine compartment are shielded and covered with heat shrink.

Wire Repair
This instruction addresses termination and splicing of J1939 wire.

Preparation of J1939 Wire for Connection

1. Strip back (view C) outer shield 3 1/8 in. (76 mm).

2. Strip (view A) green wire and yellow wire 1/4 in. (6.35 mm) being careful not to cut individual strands.

3. Re-twist all three wires if they have separated.

4. Sleeve drain wire (view B) may be soldered to aid in sleeving.

5. Install terminals on green and yellow wire ends, and crimp.

6. The 1/4” heat shrink tube (view D) will be shrunk later after the wires have been inserted into the crimp connector.
Wire Splicing
1. Strip wire ends 1/4 inch.
2. Re-twist any loose wires.
3. Slide 2-inch pieces of heat shrink tube over wire for later use.
4. Put heat shrink tube over each wire.
5. Insert ends of wires into splice joint and crimp.

6. Solder the wires and crimp joint together.

7. Center heat shrink tube over splice and shrink.
8. Wrap wires with foil tape. Maintain at least 1/2 wrap overlap.

9. Center heat shrink tube over the splice and shrink.

J1939 HIGH SPEED DATA LINK CABLE (SAE J1939/15):
The information in this section applies to all severe and medium vocational series models.

Performing the proper repairs or modifications of the cable is critical to the integrity and performance of the vehicle systems. (For repair procedure see Electrical Troubleshooting Guide - S08250 or Data Link Repair in this manual.) This information based on SAE J1939/15 and TMC RP 142.

These instructions are intended for modifications that meet the SAE spec; i.e., no internal resistor. When extending the backbone the proper materials must be used. The data link cable consists of a twisted pair of insulated wires and are covered by an insulating jacket. The data link cable must meet the SAE - specified characteristic impedance of 120-ohms. Never splice regular automotive type wire such as GXL, SXL, TXL into the data link cable. Use data link cable furnished by Raychem, part number 2021D0309.
The backbone is the main part of the cable. This is terminated at each end with a 120-ohm resistor. When adding a device, the backbone must be extended. This is done by removing the resistor, inserting the backbone extension, then plugging the resistor and the device into the extension.

**J1939:**
J1939 is a high-speed serial communications data link. The system requires two resistor caps. The first resistor cap for Body Builder J1939 currently starts in the engine compartment. The second resistor cap ends where the last module is placed. The wire between these two resistors is called the backbone. The backbone cannot be longer than 131.2 feet (40m). A module can tap into the backbone. This point is called the Node. The distance between two nodes can not be less than 3.9 inches (0.1m). The cable length from the node to the module cannot be longer than 9.8 feet (3m).

### 10.5. HIGH VOLTAGE CIRCUITS (GREATER THAN 50 VOLTS) ON INTERNATIONAL TRUCKS AND BUSES:

**WARNING** - To avoid property damage, personal injury, or death, refer to the manufacturer's service information before working on any high voltage equipment. By definition, high voltage circuits and components contain voltage levels that may cause equipment damage, electrical shock, and/or electrocution if handled incorrectly.

Only a trained technician may perform service inside high voltage components. When working around or maintaining high voltage circuits, please seek high voltage training.

**NOTE** - The intent of this section is to provide some basic guidelines when working on or around International vehicles that are equipped with high voltage electrical equipment and circuits. For specific instructions, maintenance, or service information on specific equipment or options, refer to the service manuals for the specified truck models and component(s). It IS NOT the intent of this section to provide detailed service instructions for high voltage equipment and circuits.

High voltage systems require the maintainer to be familiar with two types of electrical systems.

**DC (Direct Current)**
Most DC systems on today's trucks use 12volt negative GND. Some systems can store DC electricity in batteries with operating voltages as high as 600 DC volts.

**AC (Alternating Current)**
The main difference between AC and DC systems is that the voltage levels in DC systems remain constant while the voltage levels in AC systems are constantly changing. When measuring an AC system, it is important to know that the average voltage is zero, and that is why a voltmeter set to DC will not indicate the presence of an AC voltage when connected to an AC circuit!

High voltage can be lethal. Always refer to the manufacturer of the high voltage component when maintenance or repairs are needed. In most cases, diagnostics and repair are performed after the high voltage circuits are disabled. If working around or maintaining high voltage circuits, please seek high voltage training.

**WARNING -** To avoid property damage, personal injury, or death, circuits must be checked using a voltmeter for the presence of both DC and AC voltages. A voltmeter set to DC will not indicate the presence of an AC voltage when connected to an AC circuit! Contacting an unknown AC or DC voltage may cause equipment damage, electrical shock, and/or electrocution.

Only a trained technician may perform service inside high voltage components. If working around or maintaining high voltage circuits, please seek high voltage training.

**Understanding High Voltage Equipment and Circuits on International Products:**
Some examples of high voltage equipment that can be encountered on products are as follows:

— **Auxiliary Power Units (APUs)**

APUs are basically small diesel-powered generator units that are integrated into the vehicle electrical system. APUs are utilized in combination with inverters and battery chargers. APUs are often set up to automatically start when the electrical management system deems it necessary to maintain battery charge or electrical demand requires it.

**NOTE -** APU high voltage wiring may NOT be marked for easy identification as high voltage.

— **Shore Power**

Shore power is a connection from a vehicle to an external 120Volt AC power source. The vehicle is equipped with an exterior receptacle that allows connection to an external “shore” power source.

**NOTE -** High voltage shore power wiring may NOT be marked for easy identification as high voltage.
Inverters

Inverters are electronic devices used to change DC (Direct Current) into AC (Alternating Current). Some inverters contain converters that also convert AC to DC for battery charging or running 12V equipment.

NOTE - High voltage wiring for inverters may NOT be marked for easy identification as high voltage.

Hybrid Electric Vehicles (HEVs)

HEVs combine internal combustion engines with high voltage batteries, electric motors, and inverters to offer higher fuel efficiency and lower emissions without compromising power, range, and convenient fueling of conventional vehicles. Regardless of the HEV design, high electrical voltages and currents are present.

NOTE - The industry standard for high voltage cables is for the cables to be covered in ORANGE CONDUIT.

If orange conduit is observed on a vehicle, please review the safety precautions for that system.

How to Identify High Voltage Circuits:
High voltage circuits are not always connected with large wires. The best way to identify high voltage equipment or circuits is to be familiar with the equipment and circuit diagrams as well as to look for high voltage warning labels and orange conduit. Inspect the vehicle for any equipment or circuits added after the truck was built (owner/operators may add high voltage components such as inverters or APUs).

All electrical circuits associated with APUs, shore power, inverters, and HEVs should be considered high voltage. The standard for high voltage cabling on HEVs is orange. APUs, inverters, shore power, and cabin 110/120V outlet wiring may not indicate high voltage by visual inspection (they may not be marked and are NOT orange in color).

Servicing International Products:
The following steps outline the appropriate method to follow to identify and address any maintenance or service on International products with factory-installed high voltage equipment.

1. Complete related training prior to attempting to identify and service any high voltage system.

2. Review the line-set ticket provided with the vehicle or from ISIS, and identify all high voltage components. Inspect the vehicle for any equipment or circuits added after the truck was built (owner/operators may add high voltage components such as inverters or APUs that could be live and powering circuits in the vehicle EVEN WITH THE IGN OFF AND THE BATTERIES DISCONNECTED).
3. Refer to manufacturer’s service publications for identified high voltage components.

4. Physically locate high voltage components on the vehicle and disable them according to manufacturer’s instructions (some components may require a waiting period or special procedures to discharge the voltage completely).

5. Use Best Work Practices (see below) when performing work on electrical systems.

**Best Work Practices:**

**WARNING -** To avoid personal injury or death, permit only trained responsible and capable persons to operate or maintain the equipment. Carelessly operating or neglecting maintenance despite the safe design of any vehicle and its high voltage equipment may result in personal injury or death.

The danger of injury through electrical shock is possible whenever electrical power is present. Most fatal injuries result from high-voltage exposure; however, people can sustain severe injuries from low voltage power if it has a high current flow.

- Be aware of ALL high voltage equipment on the vehicle; review line-set/build ticket and the owner and service manuals of high voltage equipment **BEFORE** starting any work.
- When working on this equipment, remain alert at all times. Never work on the equipment when physically or mentally fatigued, and never work alone near high voltage equipment.
- Always stand on an insulated, dry surface when working on any electrical circuit. Do not handle any kind of electrical device while standing in water, while barefoot, or while hands or feet are wet.
- Always work in an adequately illuminated area.
- Always use appropriate protective equipment: insulated gloves, rubber gloves, goggles/face shield, safety shoes, protective clothing, and insulated tools when working on electrical components/circuits of the vehicle.
- Never wear jewelry when working on this equipment. Jewelry can conduct electricity resulting in electric shock or burns and may get caught in moving components causing injury.
- When working on vehicles that have high voltage devices or equipment, use appropriate alerting techniques in plain view to warn people that may be in the general area and to prevent inadvertent activation of any disabled high voltage circuit(s) during service: safety signs, safety symbols, tags, barricades, cones, etc.
- Keep a fire extinguisher close by at all times. Extinguishers rated “ABC” by the National Fire Protection Association are appropriate for use on the electrical system. Make sure the extinguisher is properly charged and be familiar with its use. Consult the local fire department with any question pertaining to fire extinguishers.
- Ensure that the high voltage power, high voltage power generating equipment, and high voltage storage devices are disconnected, locked out, or otherwise disabled **BEFORE** working on or around the vehicle, its electrical circuits, or components.
Unless disabled, Auxiliary Power Units (APUs) may start at any time without warning; when this occurs, the circuits associated with the APU become energized with potentially lethal high voltage. Some components may require a waiting period or special procedures to discharge the voltage completely.

- Use an appropriate electrical tester and procedures to confirm that the power is disconnected **BEFORE performing any work on or near any high voltage components/circuits**.
- Exercise caution around output circuits even when the input power is off. Parallel power sources and energy storage devices can still be dangerous. Be familiar with the high voltage equipment installed on the vehicle. Some systems contain high voltage condensers that may require time to discharge after power is removed.
- After disconnecting or exposing a high-voltage connector or terminal, insulate it immediately using insulation tape.
- After completion of any electrical work, **BEFORE restoring the power, verify that parts and/or tools are removed from the work area and that the fasteners are firmly tightened to the specified torque and the connectors are correctly connected**.
- Voltage can be fatal at levels greater than 60 volts. High voltage can jump a larger air gap than low voltage. If contact is made with high voltage, it may not be possible to simply “let go”.
- Towing a HEV with its drive wheels on the ground may cause the motor to generate electricity. Consult the operator’s/owner’s manual for proper towing procedures.
- If a high voltage fuse or circuit protection device trips, do not re-energize the circuit until it has been determined that the circuit is safe. See manufacturer’s troubleshooting procedures before servicing a high voltage system.
- Reference OSHA Regulations as necessary and applicable.

**Suppression:**
International® strongly recommends these electromagnetic devices be electrically suppressed, when adding electromagnetic devices such as relays, magnetic switches, and solenoids.

Unsuppressed electromagnetic devices can generate large voltage spikes which are conducted into the vehicle electrical system. These voltage spikes may adversely affect customer added electronic devices and in some instances may affect International installed electronic components.

When installing electromagnetic devices, specify suppressed units. If suppressed units are not available, diode suppression may be added as shown below:

The following suppressed relays and magnetic switches are available from International.

**Suppressed Relays and Magnetic Switches:**

<td>MAGNETIC SWITCH - CONTINUOUS DUTY (SUPPRESSED) 100 AMP</td>
</tr>
</tbody>
</table>
**Welding Information:**
Whenever electric welding is done on any part of the vehicle, it is not necessary to disconnect the International electronic modules in the cab such as the BC, RPM, and the instrument cluster. The welder's GND must be connected as close to the weld as possible. If the vehicle is equipped with an International engine, disconnect both the positive (+) and the negative (−) battery cables including the electronic power feeds prior to electric welding. If it is necessary to weld close to an electronic component, it is recommended that the component be temporarily removed.

Consult manufacturer’s instructions for all other electronic modules such as Allison Transmission, Eaton Auto Shift Transmission, Bendix ABS, Wabco ABS, Cummins Engine, Caterpillar Engine, and Detroit Diesel Engine.

**Routing Guidelines:**
Any hosing, tubing, battery cable, wiring or electrical harness must not rub on a sharp edge. However, due to the high abrasion resistance of synflex tubing, it is permissible for synflex tubing to make contact with the lower edge of the frame rail flange when the tubing is making the transition from the outside to down and under the rail. This does not mean that proper clearance or the need for protective wrap is not needed when synflex line contacts sharp edges or threaded fasteners.

Any hosing, tubing, battery cable, wiring or electrical harness must not rub or make contact with a hot surface. There should be 5" minimum clearance from the exhaust depending on the situation. The further back from the turbo, the less clearance required.

Nothing should rub or make contact with the copper compressor discharge tubing other than the clamp(s) that support it.

All hosing, tubing, battery cables or electrical harnesses should be supported at least every 18" to 20".

Straplocks used to directly clamp or support battery cables or main engine wiring harnesses must be no less than 7/16" in width.

Straplocks are not to be used on any bulk hose materials (heater hoses, make-up lines, etc.).
